

What Cirkus costs to run, and what it's built of

One container, one small database, GitHub for the pipeline, Procountor for the money. Everything below scales to zero or is on a free grant, so the bill is essentially the database until the club is large.

Architecture

Expected monthly cost by club size

1 – 10 active users /
month ← today

€18 – 22 / month

The database is the bill. The app sleeps most of the day and stays inside Azure's free grant; GitHub and logs are free.

10 – 100 active users /
month

€20 – 30 / month

Same database. The app is awake more hours, so a few euros of compute; keep it always on for ~€5 more if the cold start annoys people.

100+ active users /
month

€45 – 65 / month

One replica always on, a 2-vCore database (B2s) and more storage for receipt photos. Still one container, no code changes.

Line by line

COMPONENT	SIZED AS	1 – 10	10 – 100	100+	WHY IT MOVES
Azure Container Apps Consumption plan, the Cirkus container	0.25 vCPU / 0.5 GiB, scale 0 → 1 100+: min 1 replica, max 2	€0	€0 – 5	€5 – 15	Free grant: 180 000 vCPU-s and 360 000 GiB-s a month ≈ 200 h of this container awake. Beyond that \$0.000024 / vCPU-s active, \$0.000003 idle. Scaled to zero costs nothing.
Azure Database for PostgreSQL Flexible Server, the only data store	Burstable B1ms (1 vCore, 2 GiB), 32 GiB storage 100+: B2s (2 vCores), 64 GiB	€17 – 20	€17 – 20	€35 – 42	≈ €13 – 15 compute + €0.115 / GiB storage. Backups up to the provisioned storage size are free. Receipt photos live here (~1 MB each), so storage is what grows.
Log Analytics Container console logs	Default workspace, 30-day retention	€0	€0	€0 – 3	First 5 GB ingested per month free; Cirkus logs a few MB.
GitHub Repository, Actions, container registry	Free plan, private repo ~1 000 Actions min / month of 2 000 free	€0	€0	€0	The hourly Procountor sync uses ~720 of the free 2 000 minutes; each deploy ~5. ghcr.io keeps the image within the 500 MB free storage if old tags are pruned.
Procountor Invoicing and accounts receivable	The club's existing subscription	€0 extra	€0 extra	€0 extra	Cirkus makes 3 API calls per invoice and one per open invoice per hour — far below the limits. CHECK that API access is included in your Procountor plan.
Domain & TLS Optional custom name	Azure-issued *.azurecontainerapps.io name today	€0	€0 – 2	€0 – 2	A cirkus.kmlaviation.fi name costs the domain only (€10 – 20 a year); the managed certificate is free.
Total, all list prices		€18 – 22	€20 – 30	€45 – 65	Per month, excluding VAT.

Assumptions and levers

"Active user" here means a pilot who opens Cirkus a few times a week: bookings, one log entry per flight, an invoice a month. Admin billing runs add nothing measurable.

The one lever that matters is the database SKU. B1ms is enough well past 100 users for this workload (a few thousand rows a month); move to B2s only when the Flights and Activity pages get slow, not by user count.

Prices are Microsoft's and GitHub's public list prices in September 2026, converted 1 : 1 from USD; Swedish and North European regions run a few percent above US East. Your Azure invoice is the truth — the Cost analysis page in the portal shows the split.

Cold starts are the trade-off of scaling to zero: 10 – 20 s for the first visitor after 10 quiet minutes. --min-replicas 1 in the deploy step removes them for roughly €4 – 5 a month at the idle rate.

Stopping the database when the club is grounded for the winter halts compute billing (storage keeps ticking); Azure restarts it automatically after 7 days, so it's a manual chore rather than a schedule.

Not costed: your own time for Approvals and Billing, and Procountor's per-invoice fees if your plan has them — those existed before Cirkus.
